

[Figure 4] Perennial Fruit: Estimated Changes Associated with Insurance Expansion, 1991–2024 (Suggestive Only)

Note: Treated (nationwide year): Apple, Pear (2003); Sweet persimmon, Tangerine (2004); Astringent persimmon (2008); Plum (2012). No never-treated perennial series exists. Comparison crops are annual crops before their first pilot and, for early event times, the not-yet-treated fruit crops Astringent persimmon (to 2005) and Plum (to 2007); annual controls are not comparable perennial controls, and orchard area (a stock of trees) is compared with annual cultivated area. Pre-pilot estimates rise steadily and the post-period path continues that slope, so the estimates are suggestive at most. Sweet and Astringent persimmon series begin in 1998. Custom group-time difference-in-differences; reference year = final clean pre-pilot year ($e = -5$ to -3); crop-specific transition years omitted. 95% crop-level wild bootstrap intervals (custom procedure). Source: KOSIS Crop Production Survey (national series); author's calculations.
